Thank you for having chosen KITZ products. For safe and trouble-free function and performance of the product, ensure to read and understand all items of this manual before valve mounting and operation. Keep this manual in a convenient place for your valve operators' easy access.
This manual applies to the KITZ threaded or socket welding ends floating type 3-pieces ball valves. This manual is prepared for manual valve operation. For electric or pneumatic valve operation, refer to the operation manual prepared by the manufacturers of relevant valve actuators.

**CAUTION AND WARNING**

To ensure safe and trouble-free function and performance of the product, please read all items of this manual before handling, transportation, mounting and operation of valves. Keep this manual in a convenient place for your valve operations.

The signal words "WARNING" and "CAUTION" are defined as follows:

- **WARNING**
  - Indicating potentially hazardous conditions, which may result in death of personnel or serious injury to personnel, if such warnings shall be ignored.

- **CAUTION**
  - Indicating potentially hazardous conditions, which may result in injury to personnel or only property damage, if such cautions shall be ignored.

- Indicate prohibition of an action.
- Indicate mandatory implementation of an action.

**NOTES TO USERS**

This manual covers the normal usage of the product. Technical data and instructions for operation, maintenance and inspection of the product are prepared in consideration of safety. However, they are good only to cover typical applications as a general guideline to users. If technical assistance beyond the scope of this manual is required, contact KITZ Corporation or its distributors.

The illustrations given in this manual do not introduce all details. If more detailed data are needed, refer to our relevant valve assembly drawings.

Any information provided in this operation manual is subject to revision at any time without notice. This edition cancels all previous issues.

CHAPTER

Construction and Design Features
1. Construction and Design Features

1.1 The typical valve design is as illustrated below.

1.2 Range of operation from full opening to full closing is 90°.

1.3 These ball valves are designed for use in the full open or full closed position only.

1.4 The ball is supported by both ball seats. When the valve is pressurized, the ball moves against the downstream seat to complete the seal, shutting off flow of the line fluid.

1.5 This ball valve design may be used on applications where a bi-directional flow is needed.

This illustration represents a typical construction.
2. Design features

2.1 Body construction (Swing-away type)

Body is divided into 3 parts and it can be dismantled by loosening 4 cap bolts and removing one bolt. Therefore, it is easy to clean, check, and maintain the valve internally.

2.2 Stem Blowout Proof

The lower end of the stem is designed with an integral collar to be stem blowout proof. It also functions as the backseat for assumed stem sealing.
1. Lever Handle

1.1 The lever handle is directly mounted on the valve stem.

1.2 Rotating the lever handle by 90° fully opens and fully closes the valve.

Turning the lever handle clockwise closes the valve, and counterclockwise opens it.
## Transportation and Storage

### 1. Transportation

1.1 **Caution for transportation**

> Take care when handling and storing carton packed. High humidity may damage the cartons, leading to damage valves.

1.2 **Transportation**

1.2.1 **Keep packages as delivered just before installation.**

If protective covers are missing during transportation, provide appropriate type of protective covers.

1.2.2 **Handle valves carefully so that they may not fall or drop on the ground.** Any extraordinary mechanical impact should be avoided.

### 2. Storage

2.1 **Caution for storage**

1. **DO NOT store valves in a corrosive environment, which may cause corrosion on threaded portions of valves.**

2. **DO NOT place any other objects on valves, and DO NOT step on them.** Overloading may damage valves.

3. **DO NOT carelessly pile up products to avoid risk of product damage and personal injury caused by unstable piling.**

4. **Keep the valves in the open position during storage.** Storing the valves in the half-open position may deform the ball seats, leading to internal leakage.

2.2 **Storage**

2.2.1 **Store valves at a dust-free, least humid, and well-ventilated place.**

Indoor storage is recommended.

2.2.2 **Storage of valves directly on the ground or concrete floor is not recommended.**

2.2.3 **Take appropriate measures to prevent valves from direct exposure to dust, rain, and sunlight,** if valves should be stored outdoors.

---

### CAUTION

- **Do not store valves in a corrosive environment, which may cause corrosion on threaded portions of valves.**
- **Do not pile up products carelessly to avoid risk of product damage and personal injury caused by unstable piling.**
- **Keep valves in the open position during storage. Storing them in the half-open position may deform the ball seats, leading to internal leakage.**
- **Store valves at a dust-free, least humid, and well-ventilated place.** Indoor storage is recommended. Direct storage on the ground or concrete floor is not recommended. Take appropriate measures to prevent valves from direct exposure to dust, rain, and sunlight, especially if valves should be stored outdoors.
1. Threaded Type

1.1 Cautions for Valve installation

(1) The sealing materials determines the characteristic of service fluid and service range of pressure and temperature. Check the valve specifications with the catalogs and/or marking on the valve. Service beyond the valve specifications may cause fluid leakage and valve malfunctions.

(2) DO NOT install for pipe end service, which may cause the external leakage. In such a case, the valve end shall be tightly plugged to prevent the leakage.

1.2.2 Allow sufficient room for safe and easy operation, installation and subsequent maintenance of valves.

1.2.3 For smooth operation, inspection and maintenance of valves take appropriate measures for valves which are forced to be installed in small spaces.

1.2.4 Try not to install valves in the places where valve functions may be hampered by such outer forces as vibrations and others.

1.2.5 It is recommended to install valves on horizontal piping in an upright position.
Valve Installation (Threaded valves)

1.2 Caution for Installation

1. DO NOT disassemble valves during installation.
2. DO NOT use pipe wrenches on valves. Use spanner or other appropriate tools for valve installation.
3. DO NOT apply a spanner or other appropriate tool on the other body cap on the connecting pipe side. Apply it on the body cap on the connecting pipe side.
4. DO NOT overly thread pipes into the valves. Excessive insertion of pipes into the valves may damaging the valve seats.
5. Take care not to damage threaded areas and seat surfaces during installation.
6. Use appropriate sealing materials in threaded areas, considering temperature, types and other conditions of the media.
7. Keep valves fully open during valve installation in order to protect the ball surface.
8. Retighten the packing nut before operation. Packing tightening force may be lowered due to the stress relaxation which may take place during transportation and storage, leading to the occurrence of leakage through the gland area.
1.2.1 Check the following items before valve mounting:

1. Service conditions should be within the valve specifications.
2. Valve threads should correspond with pipe threads.
3. No damage should be found on valve and pipe threads.
4. Make sure pipe threads comply with the relevant standards by using thread gauges.

1.2.2 Before installation, the inside and threaded areas of the connecting pipes should be cleaned to remove any foreign object such as sand, dust or cutting oil.

1.2.3 Handle valves carefully so that they may not fall or drop on the ground. Any extraordinary mechanical impact should be avoided.

1.2.4 Remove the protection covers just before installation.

1.2.5 Check all threaded areas after installation and retighten them, if needed.

1.2.6 Flush piping after installation with all valves fully opened, to assure removal of any foreign object. DO NOT operate the valves during flushing.
1.3 Valve installation procedure (Threaded ends)

1.3.1 Ensure the connecting areas of pipes to valves are threaded.

1.3.2 Remove all foreign objects such as cuttings and oil from pipes, inside pipes and threaded connections of valves by using detergents and waste cloth.

1.3.3 Apply sealing agents, including seal tapes, to the threads of pipes.

1.3.4 Use appropriate tools to thread pipes into the valves.

1.3.5 Do not apply an excessive torque, when threading pipes into the valves. Torque should not exceed the value shown below.

<table>
<thead>
<tr>
<th>Nominal Size</th>
<th>Torque N-m</th>

1.3.7 Gradually increase the pressure and temperature of pipe lines, when conducting test run. Retighten all threaded areas of valves, if needed.
2. Socket welding Type

2.1 Caution for Valve installation

(1) The sealing materials determines the characteristic of service fluid and service range of pressure and temperature. Check the valve specifications with the catalogs and/or marking on the valve. Service beyond the valve specifications may cause fluid leakage and valve malfunctions.

(2) Keep a secure footing for valve installation and operation.

(3) Sufficient lighting should be prepared for valve operation.

(4) Piping should be properly supported, if needed.

2.1.1 Allow sufficient room for safe and easy operation, installation and subsequent maintenance of valves.

2.1.2 For smooth operation, inspection and maintenance of valves take appropriate measures for valves which are forced to be installed in small spaces.

2.1.3 Try not to install valves in the places where valve functions may be hampered by such outer forces as vibrations and others.

2.1.4 It is recommended to install valves on horizontal piping in a upright position.
2.2 Caution for installation

(1) Keep off the valve lifting area to prevent personal injury caused by unsecured valves.

(2) Keep a secure footing for valve installation and operation.

(3) Take care not to damage the seat surfaces during installation.

(4) Remove the body unit from pipeline before welding so that soft parts such as packing, gasket and/or ball seats may not be damaged by welding heat and caused leakage.

(5) Keep valves fully open position during valve installation and remove in order to protect the ball surface.

(6) Sufficient lighting should be prepared for valve operation.

(7) Retighten the packing nut before operation. Packing tightening force may be lowered due to the stress relaxation which may take place during transportation and storage, leading to the occurrence of leakage through the gland area.

2.2.1 Check the service conditions should be within the valve specification before valve mounting.

2.2.2 Before installation, the inside of the connecting pipes should be cleaned to remove any foreign object such as sand, dust, spatter or cutting oil.

2.2.3 Handle valves carefully so that they may not fall or drop on the ground. Any extraordinary mechanical impact should be avoided.

2.2.4 Remove the protection covers just before installation.

2.2.5 Flush piping after installation with all valves fully opened, to assure removal of any foreign object. DO NOT operate the valves during flushing.
2.3 Valve installation procedure (socket welding)

2.3.1 All welding work for mounting valve on the pipeline should be made by qualified welders in accordance with the qualified welding procedures.

2.3.2 Select the appropriate welding rods for valves and piping material. If covered welding rods are used, check that they are stored and dried appropriately.

2.3.3 For the socket-welding, it is recommended that the pipe should be withdrawn approximately 1.6 mm away from the contact with the bottom of socket, when the pipe is seated against the bottom of the socket as shown below.

2.3.4 Tack weld the pipe to the body to ensure that the installation position shall be correct.

2.3.5 Keep the valve open position, loosen the all cap bolting and remove upper side 2 bolts, then remove the body unit.

2.3.6 Select the welding rod as thin as possible to prevent overheating of the cap. And electric current should be controlled as low as possible. Taking care to be straight piping and to prevent the welding stress, weld uniformly around piping.

2.3.7 Air cooling is recommended after welding.

2.3.8 Visual inspection or non destructive examinations are required to detect cracks, overlaps and undercut or other defects.

2.3.9 After cooled the welding parts, reassemble the body unit keeping open position, then tighten the cap bolts evenly, and gradually and alternately in a star pattern. Concerning tightening torque, refer to the table of Chapter "W" section 1.3.6 of this manual.

2.3.10 Post weld heat treatment may be required depending on the pipe and valve material.

2.3.11 Gradually increase the pressure and temperature of pipe lines, when conducting test run. Retighten all threaded areas of valves, if needed.
3. Butt Welding Type

3.1 Cautions for safety

(1) Check the valve specifications with the catalogs and/or the attached nameplate. Services beyond the valve specifications may cause fluid leakage and valve malfunctions.

(2) Do not install valves for pipe end service. It may cause external leakage.

(3) Keep a secure footing for valve installation and operation.

(4) Appropriate level of lighting should be provided to the valve mounting area.

(5) Piping should be properly supported.

3.1.1 Allow sufficient room for operation, installation and subsequent maintenance of valves.

3.1.2 For smooth operation, inspection and maintenance, take appropriate actions for valves which are required to be installed in limited access locations.

3.1.3 Try not to install valves in locations where valve functionality may be hampered by external forces, such as vibration and other.

3.1.4 It is recommended to install valves on horizontal piping in an upright position.

3.1.5 Swing check valves can be used both on horizontal and vertical piping. When installed on vertical piping, they can be used only with upward flow.
3.2 Cautions for safety

(1) Keep off the valve lifting area to prevent personal injury caused by unsecured valves.

(2) Take care not to damage butt welding ends and seat surfaces.

(3) Pipes should be properly supported, if needed.

(4) Check valves are provided with stuffing inside for protection of the seat damage during transportation. Be sure to remove these stuffing completely before valve mounting.

(5) In case of globe or check valves, the arrow on the valve body indicates the direction of fluid flow. Valves should be mounted according to this arrow. For gate valves with vent holes, vent holes should be positioned to the higher pressure side in fully closed position.

(6) Retighten gland bolts before operation. Packing tightening stress may have been lowered due to the stress relaxation during transportation and storage, which may cause leakage from gland area.

(7) Retighten bolts at working temperatures to restore surface stress at sealing areas for valves used at high temperatures (≥200°C and over).

3.2.1 The service conditions should be within the range of the valve class and material specifications.

3.2.2 Before valve mounting, remove sand, dust and welding spatters from the connecting pipe interior.

3.2.3 Handle valves carefully so that they may not fall or drop on the ground. Any extraordinary mechanical impact should be avoided.

3.2.4 Remove protective covers just before valve mounting.

3.2.5 After valve mounting, all threaded portion should be checked. Retighten them, if needed.

3.2.6 The valve and pipe interior should be flushed to remove foreign objects. Do not operate the valve during flushing.
1. Cautions for Safety

(1) DO NOT apply too excessive force to operate the valves by such methods as using a pipe or any other device.

(2) Never loosen the gland nut and cap bolts of pressurized valves.

(3) DO NOT use valves in an intermediate position. Such use may damage ball seats and cause internal through-bore leakage.

(4) For valves with the gland packing design, retighten the gland nuts before operation of valves. Check a handle torque while retightening the nuts so that the operation won’t become too difficult due to over-tightening.

(5) Valve should be kept fully open during the line pressure test. Fully closing valves during the test may deform the ball seats, leading to the occurrence of internal through-bore leakage.

(6) When service temperature fluctuates, retighten the gland nut after the temperature is stabilized in preparation for occurrence of stress relaxation of the gland packing.

(7) Gradually open valves to prevent damage of pipes, when high temperature fluids such as steam are handled.

(8) Take some appropriate measures to prevent freezing, as needed.

2. Operation

2.1 Lever handle

Rotation of the valve stem by 90° fully opens or closes the valve. To close the valve, turn the operating handle clockwise according to the letters and the mark indicating the direction. Counterclockwise rotation will open the valve.
# Valve Operation

## 3. Daily Inspection

In order to operate your valves safely and satisfactorily, the daily inspection is very important. Here are the inspection items.

<table>
<thead>
<tr>
<th>Inspection</th>
<th>Areas to be inspected</th>
<th>Inspection Method</th>
<th>Remedial Measure</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
4. Trouble Shooting and Corrective Measures

(1) Wear the protective items such as goggle, gloves, working boots.

(2) More stringent protective measures may be necessary when handling toxic, inflammable or corrosive media.

(3) Ensure to reduce the line pressure to the atmospheric level, before retightening the packing nut or cap bolting, and loosening or replacing packing rings and gaskets.

(4) When retightening the cap bolts, care should be taken for a possible gasket blowout. Operation should be carried out at the position where operators do not get a direct exposure of the media, even if such a blowout occurs.

(5) Ensure to reduce the line pressure to the atmospheric level, before replacing packing rings and gaskets or loosening bolts and nuts. Operation should be carried out at the position where operators do not get a direct exposure of the media.

(6) DO NOT apply the lubricant to the pipes and valves which handles oxygen.

4.1 Leakage from the gland area

Retighten the gland nuts, if leakage from this area is detected. Adequate torque should be applied when retightening the gland nuts so that the valve operation won't become difficult. If it does not stop the leakage, the packing rings should be replaced.

4.2 Leakage from the flanged areas

Evenly retighten the bolting alternately and gradually in a star pattern.
## Valve Operation

### 5. Trouble Shooting

</tbody>
</table>
1. Periodic Inspection

1.1 A periodic inspection with valves mounted to pipelines is recommended at least once a year.

1.2 Ensure the smooth operation and safety of valves before inspection.

1.3 Inspection items and methods are same as daily inspection. See Chapter V for the items and methods suggested.

1.4 Where valves and adjoining piping are not daily inspected or not operated for a long period of time, a periodic inspection is also recommended. (A periodic inspection should be carried out on all valves.)

1.5 It is recommended to replace the gland packing and gaskets every time the periodic inspection is conducted.
2. Inspection and maintenance

In case pipelines or facilities where valves are installed are shut down for the pipeline inspection, remove the valves from the pipelines and perform the body and seat pressure tests as well as operation tests, if needed. If any defect is found, disassemble the valves for further inspection. The valves must pass required inspections before being sent back to the pipelines or facilities for reinstallation.

2.1 Cautions for removal of the valves from pipelines or installation of the valves on pipelines.

(1) Discharge the fluid from the pipes and reduce the line pressure to the atmospheric level when disassembling valves. Trapped pressure or fluid is very dangerous and cause accidents resulting in personal injury. In case of installation of pipe end service, the fluid might enclose between the valve and the blank plugged end. Open the valve and discharge the fluid from the pipe before the blank plugged end removal.

(2) Discharge the fluid and pressure trapped within the valve body with the valve intermediate position before disassembling.

(3) In case fluid is toxic, inflammable or corrosive, remove the fluid completely from pipes and internal valves.

(4) Take protective measures to prevent direct exposure to the fluid and catching fire.

(5) Keep off the working area to prevent personal injury if valves are installed at higher places.

WARNING

![WARNING](image)

CAUTION

![CAUTION](image)
2.2 Assembly and disassembly
Refer to Chapter VII for disassembly and reassembly.

2.3 Test and Inspection
Refer to the following procedure for test and inspection.

2.3.1 Operation Test
(1) Check smooth operation of valves without galling or sticking of internal valve components.
(2) Check that the stem is firmly assembled with the ball.
(3) Ensure that there should be no offset of the ball port and ball seats in the fully open position. The ball should not be protruded into the valve port other than the rounded surface of the ball port edges.

2.3.2 Shell Test and Seat Leakage Test

(1) Care for shell test and seat leakage test.
(2) Wear the protective items such as goggle, gloves and working boots.
(3) Before shell test and seat leakage test begin, take some precautions for operators safety.

All valves should be subjected to a hydrostatic or pneumatic shell test and seat leakage test at the required test pressures after reassembly. Refer to JIS B 2003, JPI-7S-39 or API 598 for test methods and procedures.
Disassembly and Reassembly of Valves

1. Disassembly procedure

1.1 Care for disassembly

(1) Operator should take an appropriate caution for not being exposed to the fluid or catching fire.

(1) Keep valves fully open position during valve remove in order to protect the ball surface.

(2) Wear the protective items such as goggle, gloves and working boots.

1.2 Before Disassembly

1.2.1 Place the valve in a dust-free place.

1.2.2 Take care not to damage the flange surface, ball, stem and other parts.

WARNING

CAUTION
1.3 Disassembly procedure

1.3.1 Full open the valve.

1.3.2 Remove the cap bolts (35), then disassemble the body (1) and body cap (2). It is available to swing away the body from the body cap loosening 4 bolts and remove one bolt.

1.3.3 Remove the gasket (19) and ball seats (30) from the body (1).

1.3.4 Remove the ball (4) from the body (1) keeping valves open position.

1.3.5 Remove the handle nut (10), spring washer (16A), lever (9), lock plate (40), gland nut (34), coned disc spring (43) and gland (7) from the stem (3).

1.3.6 Push the stem (3) down into the body cavity to remove it from inside the body (1).

1.3.7 Remove the packing (8) from the body (1).

1.3.8 Remove the thrust washer (47) from the stem (3) or the body (1).
2. Reassembly procedure

2.1 Care for reassembly

(1) DO NOT apply the lubricant to the pipes and any parts of contact with fluid which handles oxygen.

(2) Wear the protective items such as goggle, gloves and working boots.

(3) No open flame or smoking should be allowed in the working area.

(4) Take care not to catch fingers in flanges during assembly.

(5) Soft parts such as packing, gasket, ball seat and thrust washer shall be replaced to the new one. It may cause the leakage when they are reused.

2.2 Before Assembly

2.2.1 Check all parts before assembly. If any problem is detected, replace the valve.

2.2.2 Prepare new soft parts (ball seat, packing, gasket and thrust washer) before assembly.

2.2.3 Clean all parts for reuse to thoroughly remove dust and other foreign objects.

2.2.4 Assemble the valve in a dust-free area.

2.2.5 Take care not to damage all parts especially the ball, ball seats and stem.

2.2.6 Keep in mind that all threads should be securely tightened.
2.3 Reassembly procedure

2.3.1 Mount the thrust washer (47) on the stem (3).

2.3.2 Assemble the stem (3) into the body (1) from the body interior. Ensure that the stem collar securely contacts the body.

2.3.3 Assemble the packing (8), gland (7), and coned disc spring (43) to the body then tighten the packing nut (34).

2.3.4 Assemble the lock plate (40), lever (9) and spring washer (16A) to the stem (3), then tighten the handle nut (10) and that the valve position is fully closed.

2.3.5 Place the ball (4) into the body (1).

2.3.6 Open the valve then assemble the ball seats (30) and gaskets (19) on the body (1).

2.3.7 Securely screw the 4 cap bolts (35) after body (1) install between the two body caps. Bolts/nuts should be tightened evenly, and gradually and alternately in a star pattern. Concerning tightening torque, refer to the table of Chapter section 1.3.6 of this manual.

2.3.8 Tighten the packing nut (34). Check a handle torque while tightening the nuts so that the operation won’t become too difficult due to over-tightening.

2.3.9 Tighten the handle nut (10).
